

Yash Bhardwaj

Senior Software Development Engineer | Distributed Systems, Microservices, Cloud, CI/CD | Python, Java, TypeScript
Bangalore, India | +91-8178084472 | yashbhardwaj911@gmail.com | [LinkedIn](#) | [Website](#) | [Github](#)

Software engineer with 5 years building high-availability backend platforms, microservices, and automation pipelines across data-center and enterprise environments. Designs distributed systems that hold up when things fail: idempotent workflows, fault-tolerant job orchestration, and CI/CD pipelines with observability built in. Works day to day in **Python, Java, and TypeScript** across **AWS and Azure**, with production RAG and LLM tooling shipped on the same stack.

EXPERIENCE

AMD

September 2025 – Present

Senior Software Development Engineer, DCAuto Platform

Bangalore, India

- Develop automation for **DCAuto**, AMD's internal platform running firmware CI and regression testing for **MI450 data-center GPUs**, scheduling deploys and test workloads across a fleet of physical systems under test (SUTs).
- Shipped **PSN self check-in**, an idempotent subsystem with automatic fallbacks that lets DCAuto deploy and submit workflows recover from transient infrastructure and SUT failures instead of being rerun by hand.
- Built **DCAutoAI / Sherlog Holmes** at the AMD AI Hackathon: a **RAG** triage pipeline that pins root cause in 50,000-line GPU firmware logs using FAISS vector search and an LLM, served by Flask APIs over Celery and Azure Service Bus with MongoDB storage and Teams alerts.

Qualcomm

August 2022 – June 2025

Software Engineer

Bangalore, India

- Delivered the first macOS universal release of Qualcomm Software Center (QSC) as the sole engineer on the port, resolving cross-platform dependencies for Fortune 500 OEMs including Apple, Samsung, and Bosch.
- Owned release management for QSC and rebuilt its **AWS** deployment pipelines with centralized logging and monitoring, cutting release times by **50%**.
- Designed the high-availability architecture behind QSC, an Electron desktop client on Node.js, Angular, and TypeScript that delivers device drivers to OEMs worldwide.
- Engineered the API gateway layer for QSC and led its migration from Axway to **Apigee**, sustaining thousands of requests per second.
- Worked directly with engineering managers and enterprise customers at Microsoft, AT&T, and BMW to scope UI feature releases and triage production bugs against release deadlines.

Licious

June 2021 – July 2022

Software Development Engineer

Bangalore, India

- Implemented **RESTful APIs** and microservices in **Java (Spring Boot)** and PHP for a nationwide point-of-sale (POS) system, cutting API response times by **25%** across 100+ delivery centers.
- Wrote an automated API test framework on REST-assured, raising test coverage across the order-processing path.
- Containerized services with **Docker** and automated deployments on **Kubernetes**.

SKILLS

Languages: Python, Java, JavaScript, TypeScript, SQL

Frameworks: Spring Boot, Flask, Node.js, Angular, React, Electron, Celery

Cloud & DevOps: AWS, Azure, Docker, Kubernetes, Jenkins, Git, Linux, CI/CD, continuous integration & delivery

Data: PostgreSQL, MongoDB, Redis, REST APIs, message queues

AI/ML: RAG, LLM integration, FAISS, vector search, embeddings, TensorFlow, PyTorch

Practices: distributed systems, microservices, system design, high availability, observability, Agile

PROJECTS

Prognostics of Part Degradation in Turbofan Engines | *Thesis, BITS Pilani*

- Trained LSTM and ensemble models in **TensorFlow** on the NASA CMAPSS turbofan sensor dataset, reaching an R^2 of **0.75** on engine life-cycle prediction.

DeepFake Generation and Detection with GANs | *Independent Project*

- Modeled generative adversarial networks in **PyTorch** for image synthesis and detection, reaching **80%** accuracy.

EDUCATION

BITS Pilani, K.K. Birla Goa Campus

Bachelor of Engineering (Hons.)

2017 – 2021

Goa, India
